

Access and disseminate the complete library of published evidence

What is CitationPoint? CitationPoint is a customizable software interface from S² Statistical Solutions that allows you to pull important endpoints from published literature that are of value to you and your clients.

How Does CitationPoint Work?

STEP 1: CitationPoint identifies search terms that will capture the body of evidence you are interested in extracting from the published literature.

STEP 2: CitationPoint builds an online Data Extraction Form (DEF) that will capture and categorize the key elements of interest from the published literature.

STEP 3: CitationPoint searches the published literature for all articles that meet your search criteria.

STEP 4: DEF's are populated online from each journal article meeting your search criteria.

STEP 5: Customized Dynamic Evidence Grids are built into the database that allow you to search, filter, organize, count, and display key data elements. These grids allow you to:

- Link important fields of interest
- Link PDF's of actual articles to the GRIDS
- Automatically update as new data is entered
- Allow for quick reporting of the evidence in the published literature

Why Use CitationPoint?

Quick access to the evidence

Respond to health technology assessments or reimbursement initiatives

Perform gap analysis

Link commercial, marketing, and regulatory claims directly to the published literature

Identify where holes exist in the evidence

Pinpoint where evidence has already been won

Inform clinical trial designs

Synthesize endpoints for meta-analysis from the extracted data

What are Benefits of CitationPoint?

Understand the evidence that exists on your drug or device

Share evidence securely across departments in your organization including Marketing, Reimbursement, Clinical, and Regulatory

statistical solutions
